

DriveLegal — Report & Shift Vehicle Spec

Fixes for logbook PDF report header and per-shift vehicle/rego capture

Prepared for: Replit build task | Generated: 18 August 2026

1. Problem Summary

The Drive Legal Logbook Report currently shows a single static vehicle type and registration in the header, pulled from the driver's profile. In reality drivers switch vehicles and driver types (SPS, Large Passenger, Goods, Recovery) across shifts, so a fixed header is inaccurate — e.g. a Large Passenger shift showing vehicle type 'Hatchback' makes no sense. Vehicle and registration need to be captured per shift, at the point the driver starts that shift, and reflected per-row in the report rather than as a static header value.

2. Report Header Fix

Remove from header:

- Vehicle type (e.g. 'Hatchback')
- Vehicle registration (e.g. 'REL10')

Keep in header:

- Driver name
- Licence number
- Generated date/time

Add to header:

- Reporting period (date range covered by the report, e.g. '3 Aug 2026 – 16 Aug 2026')

Rationale: vehicle and registration are shift-level facts, not driver-level facts, and already appear correctly broken out per row in the table body. NZTA logbook guidance does not require a single vehicle to be declared for the whole report — records must be continuous, accurate, and tied to the actual work performed, which favours per-shift attribution over a static header value.

3. Shift-Start Flow: Vehicle Capture

Update the shift-start flow so vehicle and registration are captured per shift, not inherited once from the driver profile.

Proposed flow:

- 1 Driver registers a permanent/default vehicle on their profile (existing behaviour, kept as the default).
- 2 At shift start, driver selects Driver Type first (SPS, Large Passenger, Goods, Recovery).
- 3 After Driver Type is selected, the driver's default vehicle is shown/pre-filled automatically.
- 4 If the driver is using a different vehicle for this shift, they select "Change vehicle" and manually enter: vehicle type, registration number, and starting mileage/odometer reading.

- 5 The selected vehicle type, registration, and starting mileage are stored against that specific shift record — not overwritten on the driver profile.

Data model implication:

Each shift record needs its own vehicle_type, registration, and start_mileage fields (in addition to whatever end/finishing mileage is already captured), rather than joining to a single static vehicle record on the driver's profile. Report generation should read vehicle info from the shift record, not the profile.

4. Acceptance Criteria

- Report header no longer shows vehicle type or registration.
- Report header shows driver name, licence number, reporting period, and generated date/time.
- Each row in the report table continues to show the vehicle type and registration used for that specific shift.
- Shift-start flow prompts Driver Type first, then vehicle (defaulting to the driver's registered vehicle).
- Driver can override the default vehicle at shift start and enter registration + starting mileage manually.
- Vehicle/rego/mileage entered at shift start is stored on the shift record and used consistently in exports (PDF, CSV, Excel).

5. Out of Scope (this task)

Compliance threshold logic (SPS 7-hour vs standard 5.5-hour continuous work limits) is not part of this fix and should not be touched here — that is tracked separately.
